- Programme management support

• Project management

- Requirements design and development
- Research

• Risk assessment

- Technical support

• Test(ing) & acceptance

AMISOM - United Nations

SITUATION

AMISOM was a UN approved peacekeeping mission within war-torn Somalia. The objective was to take all appropriate measures to:

- support dialogue and reconciliation
- assist free movement and safe passage
- provide protection for everyone involved, including political, clan, religious leaders and representatives from all levels of civil society.

TASK

To design, develop and install an ICT Wide Area Network using satellite and teleport technologies to support a 4,000 mile rear-link and operate across 640,000 km² of hostile territory.

ACTION

- Quality assurance throughout the project
- All technical support documentation
- Assistance with design and implementation, using PRINCE2 and Agile processes
- Full security of the WAN communications through the implementation of encryption technologies for storage as well as transfer.

RESULT

- Established vital communications in a nation wracked by civil war
- Transferred essential information, protecting it from malicious attack
- Underpinned the rebuilding of civil, judiciary and protection infrastructure.

“Strategic communications are essential when trying to establish stability and order to a nation in upheaval. SA Group brought intelligence, insight, rigour and assurance into our ICT requirement and delivered a world-class system in some of the harshest conditions imaginable.”

John Montell, Associate Director,
Project Lead

Created and built a completely new IT infrastructure, safety assured, security encrypted and operational throughout the mission, operating across huge distances, in a challenging location torn apart by civil war.
